

Portfolio Builder Track · Week 01 · Proof Statement

Chashman Aslam · BSCS Sem 6, MUST Multan · Roll: 2023-CS-F031 · FlyRank ML Intern

1 AI Interview Transcript — Narrowing the Claim

Claude acted as a sharp portfolio consultant, running 5 rounds of Socratic questioning to pressure-test and narrow the proof statement. Push-backs are shown in red. Refined answers are shown in green.

Q1: You said 'AI application developer.' That could mean anyone who put a chatbot on a webpage. What do you actually build that a team lead couldn't hire a React dev for?

→ I connect real ML models — trained by me, on real medical/domain datasets — to usable interfaces. NeuroScan AI is not a wrapper around an API; the ConvNeXt-CBAM model is mine, the Grad-CAM++ heatmap overlay is mine. The Streamlit app is the delivery layer for my own model.

■ *Better. But 'usable interfaces' is still soft. What makes yours production-worthy vs a student notebook?*

✓ Mine ship with explainability (Grad-CAM++, Otsu masking), auto-reset on new input, and are demo-able in a browser with no setup. NeuroScan AI runs on Streamlit Cloud. SWAG pipeline has a live Streamlit demo. NOOR has a RAG chatbot in Urdu.

Q2: 'International remote ML team lead' — what problem does that person have that you solve? Why would they hire a Sem 6 student over someone with 3 years XP?

→ They have ML models that work in notebooks but never get to users. I close that gap. I can train the model AND build the frontend AND deploy it — most ML engineers hand off to a separate frontend team. I don't need to.

■ *That's a real differentiator. But can you prove it? Name one project where you did all three.*

✓ NeuroScan AI: I trained ConvNeXt-CBAM on brain MRI data, built the Streamlit UI with 3D animated landing page and heatmap overlay, and deployed it. One person, end-to-end.

Q3: Your Next.js AI Learning Platform involved API integrations and a server-side proxy. Is that ML or web dev? Don't pad the claim.

→ That's web dev with AI integration — not pure ML. I'm not claiming it as ML work. My ML claim rests on NeuroScan, NOOR, JIGSAWS, SWAG — all with trained models, not API wrappers.

■ *Good. Keep it honest. So your claim is: ML model + deployed interface. Not 'AI developer' generically.*

✓ Correct. I train domain-specific models (medical imaging, NLP, surgical AI) and ship them as working applications. That's the specific claim.

Q4: Why would this team lead email you specifically? What's the one sentence that makes them stop scrolling?

→ Because they can see a working demo of a medical AI app — not a GitHub repo with a README, an actual app in the browser — built by one person who did the ML and the interface.

■ *That's your hook. 'See it running' is the proof a CV can't give. Make sure every project has a live link or a video.*

✓ NeuroScan AI is on Streamlit Cloud. SWAG has a demo. NOOR has a video. Noted — I need to make these links prominent on the portfolio.

Q5: Final check. Your statement says 'I build AI applications that connect trained ML models to real users.' Could any other ML student say that?

→ No — because I can prove it with 4 deployed demos across medical imaging, surgical AI, criminal justice NLP, and SEO-ML. Most students have one project. Mine span 3 domains and all have working interfaces.

■ *That's your proof. Write the statement with that specificity. Don't say 'multiple domains' — name them. Don't say 'several projects' — name the count.*

✓ Agreed. Final statement will name the domains and the project count explicitly.

2 Final Proof Statement

THE CLAIM + THE PERSON + THE ACTION

I build AI-powered applications that take trained machine learning models from notebook to browser — handling the model, the interface, and the deployment as one person. Across four domains (medical imaging, surgical AI, criminal justice NLP, and SEO-ML), I have shipped five working applications: NeuroScan AI classifies Alzheimer's MRI with explainability overlays; NOOR scores recidivism risk and answers legal questions in Urdu; the JIGSAWS system assesses surgical skill at ~87% accuracy; the SWAG pipeline anticipates surgical workflow steps in real time; and my FlyRank internship work models CTR opportunity from Google Search Console data. If you lead a remote ML team that builds models but struggles to put them in front of real users, I close that gap — email me and I will show you a live demo within the hour.

ONE CLAIM

I build AI-powered applications that take trained ML models from notebook to browser — handling model, interface, and deployment as one person.

ONE PERSON

A remote ML team lead whose team builds models but struggles to put them in front of real users.

ONE ACTION

Email me and I will show you a live demo within the hour.

3 One-Line Why — What a CV Cannot Prove

ONE-LINE WHY

A CV says I know PyTorch and Streamlit; this portfolio proves I can take a trained medical AI model and put it live in a browser — alone, start to finish — which is the thing a remote ML team lead actually needs to see before hiring.

Pass / Revise Checklist

- ✓ **One primary claim is named, not three skills hiding behind 'and'**
AI application developer who connects trained ML models to deployed interfaces — one skill, named.
- ✓ **Audience is a specific person who could hire you, not 'everyone'**
Remote ML team lead whose team ships models but can't get them to users — specific problem, specific person.
- ✓ **A single most-important action is chosen**
'Email me and I will show you a live demo within the hour' — one action, low friction, specific offer.
- ✓ **Statement could only describe your proof, not any portfolio**
5 domains, 5 live apps, one person who did model + interface + deployment — this cannot describe anyone else.
